No I've not tried paxil but I know what you mean about the side effects on the sex life, my libido has dropped significantly and It seems I can no longer orgasm so I don't know what to do about that. I am also on medication, paxil 40mg, and welbutrin because of the side effect of paxil of low sex drive. I slowly moved my dose later and later until now I take them at night and its made such a big improvement, I now sleep for more regular amounts of time, wake early feeling refreshed with much more 'get up and go'. I cant really say if it's propranolol or venlafaxine that helps with the anxiety but either way it has decreased dramatically but hasn't disappeared all together, I still get a bit on a night but not enough to stop me drifting off to sleep after a while, it's just the case of having to read or something until I'm tired enough to sleep, which to be fair doesn't take me long. We want the forums to be a useful resource for our users but it is important to remember that the forums are not moderated or reviewed by doctors and so you should not rely on opinions or advice given by other users in respect of any healthcare matters. I was told if you add wellbutrin to your medication it will combat the sexual side effects. Always speak to your doctor before acting and in cases of emergency seek appropriate medical assistance immediately. Does anyone else feel tired all the time I always have to push myself to get things done. I feel like I can wear out fast and when I sleep I can sleep for like 10h to 12h straight.
